

Bottom Load PowrDipper® Drop

Designed for the Parallel Milking Parlor

The modern parallel milking parlor is a place of fast activity: get the cows in, get 'em prepped, milked and released. The time allotted for udder preparation and post milking sanitation is usually at a minimum.

At RJB we designed the Bottom Load PowrDipper just for this purpose. The dip delivery hose is attached to the bottom of the handle and a 180 degree hook is attached to the top of the gun. The delivery hose typically is placed under the curb of the stalls with enough hose to allow the gun to be used on at least three cows. The milker can pick up a gun at one end of the parlor, dip three cows, hang it on the curb and pick up another gun. Because the PowrDipper hangs in an upright position and is always within easy reach the milker has convenient access to the dipping tool and is less likely to skip the dipping routine when pushed for time. The milker merely grabs the pistol grip handle, pulls the trigger and proceeds to dip all four teats by pushing the cup all the way up to the base of the udder while the trigger is held open. The patented PowrDipper will coat the teats with sanitizer from the tips of the teats to the base of the udder.

When used with an RJB teat dip pump, field studies have shown that an RJB PowrDipper system can save up to 75% in teat dip usage.*
