Features and Benefits

Keeping your cows' hooves hard and strong can have major benefits for your dairy operation. Poor heel condition can cause lameness which can add major expenses to your farm. Between the combination of lessened milk production, decreased reproductive performance, and in severe cases, culling, many estimates place hoof-related issues as the third-most costly health-related issue (behind mastitis and reproduction loss).

However, a new product from CID LINES®, An Ecolab Company uses a powerful combination of glutaraldehyde with just the right amount of copper sulfate and aluminum sulfate to help with these challenges. When used regularly at 3% in foot baths, Pediline can promote hoof hardness which allows your dairy cows to better stand up to a wide range of farm conditions.

Directions for use

For 5 consecutive days each month, use a **2-5%** solution of Pediline (for a standard 50-gallon footbath, 1.5 gallons of Pediline to 48.5 gallons of water is typical). For best results, the product should be in **direct contact** with the hooves for at least **5 minutes** and foot baths should be changed every 200-300 cows or until water is visibly contaminated.

Safety instructions for the user : Please check the MSDS. Before use, read the label and the information concerning the product

Pediline is also safe to use in dilutions of up to 20% and can be sprayed directly on hooves.
